Marks
[10] 1. One side of a right triangle is measured to be 3 with a maximum possible error of $\pm 0.1$, and the other side is measured to be 4 with a maximum possible error of $\pm 0.2$. Use the differential or linear approximation to estimate the maximum possible error in calculating the length of the hypotenuse of the right triangle.
[10] 2. Assume that $f(x, y)$ satisfies Laplace's equation $\frac{\partial^{2} f}{\partial x^{2}}+\frac{\partial^{2} f}{\partial y^{2}}=0$. Show that this is also the case for the composite function $g(s, t)=f(s-t, s+t)$. That is, show that $\frac{\partial^{2} g}{\partial s^{2}}+\frac{\partial^{2} g}{\partial t^{2}}=0$. You may assume that $f(x, y)$ is a smooth function so that the Chain Rule and Clairaut's Theorem on the equality of the mixed partials derivatives apply.

[10] 3. You are standing at a location where the surface of the earth is smooth. The slope in the southern direction is 4 and the slope in the south-eastern direction is $\sqrt{2}$. Find the slope in the eastern direction.

December 20, 2005 MATH 200 Name
[10] 4. Consider the surface $z=f(x, y)$ defined implicitly by the equation $x y z^{2}+y^{2} z^{3}=$ $3+x^{2}$. Use a 3 -dimensional gradient vector (no credit will be given for using any other method) to find the equation of the tangent plane to this surface at the point $(-1,1,2)$. Write your answer in the form $z=a x+b y+c$, where $a, b$ and $c$ are constants.
[20] 5. Let $z=f(x, y)=\left(y^{2}-x^{2}\right)^{2}$.
(a) Make a reasonably accurate sketch of the level curves in the $x y$-plane of $z=f(x, y)$ for $z=0,1$ and 16. Be sure to show the units on the coordinate axes. [10\%]
(b) Verify that $(0,0)$ is a critical point for $z=f(x, y)$, and determine from part (a) or directly from the formula for $f(x, y)$ whether $(0,0)$ is a local minimum, a local maximum or a saddle point. [5\%]
(c) Can you use the Second Derivative Test to determine whether the critical point $(0,0)$ is a local minimum, a local maximum or a saddle point? Give reasons for your answer. [5\%]

December 20, 2005 MATH 200 Name Page 7 of 10 pages
[10] 6. Use the Method of Lagrange Multipliers (no credit will be given for any other method) to find the minimum value of $z=x^{2}+y^{2}$ subject to $x^{2} y=1$. At which point or points does the minimum occur?

December 20, 2005 MATH 200 Name Page 8 of 10 pages
[10] 7. Find the centre of mass of the region $D$ in the $x y$-plane defined by the inequalities $x^{2} \leq y \leq 1$, assuming that the mass density function is given by $\rho(x, y)=y$.
[10] 8. Consider the region $E$ in 3-dimensions specified by the inequalities $x^{2}+y^{2} \leq 2 y$ and $0 \leq z \leq \sqrt{x^{2}+y^{2}}$.
(a) Draw a reasonably accurate picture of $E$ in 3-dimensions. Be sure to show the units on the coordinate axes. [5\%]
(b) Use polar coordinates (no credit will be given for any other method) to find the volume of $E$. Note that you will be "using polar coordinates" if you solve this problem by means of cylindrical coordinates. [5\%]
Hint: $\int \sin ^{n} u d u=-\frac{1}{n} \sin ^{n-1} u \cos u+\frac{n-1}{n} \int \sin ^{n-2} u d u$.

December 20, 2005 MATH 200 Name
[10] 9. A triple integral $\iiint_{E} f d V$ is given in iterated form by

$$
\int_{y=-1}^{y=1} \int_{z=0}^{z=1-y^{2}} \int_{x=0}^{x=2-y-z} f(x, y, z) d x d z d y
$$

(a) Draw a reasonably accurate picture of $E$ in 3 -dimensions. Be sure to show the units on the coordinate axes. [5\%]
(b) Rewrite the triple integral $\iiint_{E} f d V$ as one or more iterated triple integrals in the order $\int_{y=}^{y=} \int_{x=}^{x=} \int_{z=}^{z=} f(x, y, z) d z d x d y .[5 \%]$
